

NOV 2023

Last chance to see four planets in the early evening sky. Autumn constellations are now high in the South and overhead, and winter constellations are appearing to the East.

Skytour map

Constellations

AND - Andromeda - *the Chained Lady*
 AQL - Aquila - *the Eagle*
 AQR - Aquarius - *the Water Bearer*
 ARI - Aries - *the Ram*
 AUR - Auriga - *the Charioteer*
 BOO - Boötes - *the Herdsman*
 CAM - Camelopardalis - *the Giraffe*
 CAP - Capricornus - *the Horned Goat*
 CAS - Cassiopeia - *the Queen of Ethiopia*
 CEP - Cepheus - *the King of Ethiopia*
 CET - Cetus - *the Whale*
 CRB - Corona Borealis - *the Northern Crown*
 CYG - Cygnus - *the Swan*
 DEL - Delphinus - *the Dolphin*
 EQU - Equuleus - *the Little Horse*
 GRU - Grus - *the Crane*
 HER - Hercules - *Hercules*
 LAC - Lacerta - *the Lizard*
 LYN - Lynx - *the Lynx*
 LYR - Lyra - *the Harp*
 MIC - Microscopium - *the Microscope*
 OPH - Ophiuchus - *the Serpent Bearer*
 PEG - Pegasus - *the Winged Horse*
 PER - Perseus - *the Hero*
 PSA - Piscis Australis - *the Southern Fish*
 PSC - Pisces - *the Fish*
 SCL - Sculptor - *the Sculptor's Workshop*
 SCT - Scutum - *the Shield*
 SER - Serpens - *the Snake*
 SGE = Sagitta - *the Arrow*
 SGR - Sagittarius - *the Archer*
 TAU - Taurus - *the Bull*
 TRI - Triangulum - *the Triangle*
 UMA - Ursa Major - *the Great Bear*
 UMI - Ursa Minor - *the Lesser Bear*
 VUL - Vulpecula - *the Little Fox*

Planets

♃ - Jupiter, ♄ - Saturn,
♅ - Uranus, ♆ - Neptune

How to Use the Chart

South is at the bottom, if you hold the chart “up” against the sky, facing South, then East will be to your left and West to the right.

Because of the Earth’s motion around the Sun, the time of this chart changes slowly over time, becoming roughly 1/2 hour earlier every week:

Date	Time
Nov 1	9 PM (EDT)
Nov 8	9:30 PM (EST)
Nov 15	9 PM
Nov 22	8:30 PM

The Milky Way stretches overhead from the West in down to the Southwest in Aquila and Cygnus, over to the East in Auriga. Jupiter dominates the sky, in Aries; Saturn is now low in the Southwest.

For binoculars, the Andromeda Galaxy and the fainter Triangulum Galaxy are almost overhead, and many star clusters can be found scanning along the Milky Way from Cygnus, through Cassiopeia, on to Perseus, and Auriga. Taurus, rising in the East has both the Hyades and Pleiades. Another bright globular cluster is M 15 just off of the head of Pegasus.

Telescopes can check out the Crab Nebula (M 1), the Perseus Double Cluster, and there are several surprising galaxies to be discovered in Cetus and Sculptor. Finally, don’t forget the often-neglected dim constellation of Camelopardalis: where there are several noteworthy deep-sky objects: remote globular NGC 2419, Caldwell 5 “The Hidden Galaxy”, NGC 2416 “The Dusty Hand Galaxy”, and a few small but interesting planetary nebulae: NGC 1501, and IC 3568 “The Lemon Slice Nebula”.
